APPENDIX 5: INDICATIVE EXAMPLES OF INFECTIOUS SUBSTANCES INCLUDED IN CATEGORY A IN ANY FORM UNLESS OTHERWISE INDICATED

APPENDIX 6. QUEEN’S UNIVERSITY: TRANSPORTATION OF DANGEROUS GOODS CHEMICAL CLASSIFICATION PROFILE
1.0 Scope

The purpose of this document is to set guidelines and procedures for the safe handling and transportation of dangerous goods to and from Queen’s University. This procedure applies to products that are defined as dangerous goods under the Transportation of Dangerous Goods Regulations (TDG). Included are products as well as waste chemical, radioactive and biological products and organisms. As a general rule all research associated products fall under some category of the TDG legislation and therefore this procedure applies and must be followed. The regulations apply when dangerous goods are:

- Received and/or Shipped by Queen’s University employees
- Transported more than three kilometres on public roads, by air, or rail
- Shipped within Canada or Internationally

2.0 Applicable Legislation:

Transportation of Dangerous Goods Act, 1985
Transportation of Dangerous Goods Act, and regulations R.R.O. 1992
ICAO Technical Instructions for the Safe Transport of Dangerous Goods by Air.
IATA Dangerous Goods Regulations, International Air Transport Association, 1999
CNSC Transport Packaging of Radioactive Materials Regulation 2000
IAEA Regulations for the Safe Transport of Radioactive Material TS-R-1 1996
Laboratory Biosafety Guidelines, Health Canada
Environmental Protection Act
Ontario General Waste Management Regulation, Reg. 347 and 558/00

The Transportation of Dangerous Goods Regulation can be viewed at: http://www.tc.gc.ca/eng/tdg/clear-tofc-211.htm

3.0 Definitions

Carrier: means a person who has possession of dangerous goods while they are in transport

Dangerous Good: A product, substance or organism included by its nature or by the TDG regulations in any of the classes listed in the schedule of the act.

ERAP: Emergency Response Assistance Plan is required for quantities exceeding those listed in column 7 of schedule 1 of the TDG Clear Language Regulations
HWIN: (Hazardous Waste Information Network), a web based waste management program administered by the Ministry of the Environment (MOE). The system keeps track of waste manifests, and all generators, shippers and receivers must be registered along with the names of individuals responsible for the signing of manifests.

IAEA: International Atomic Energy Agency

IATA: International Air Transportation Association

Receiver (Consignee): Initial person who receives a consignment of dangerous goods

Shipper (Consignor): a person who offers a consignment of dangerous goods for shipment

TDG: Transportation of Dangerous Goods

4.0 Responsibilities

The department head/director is responsible for ensuring that employee(s) in their department who have been designated to handle dangerous goods comply with the TDG Regulations as outlined in this document and have received the appropriate training.

5.0 Training

An individual who RECEIVES and/or SHIPS dangerous goods, including hazardous waste must receive the appropriate TDG training and be knowledgeable about their requirements under the regulations.

A training certificate is valid for three years under TDG after which the individual must undergo re-certification. An un-trained individual may handle dangerous goods provided the goods are handled in the presence and under the direct supervision of an individual who holds a training certificate.

Courses offered:

- **Transportation of Dangerous Goods Training for Queen’s University Shippers and Receivers**, available online at [http://www.safety.queensu.ca/courses/](http://www.safety.queensu.ca/courses/)
- **Transportation Of Dangerous Goods: Biohazard Module**, available online at [http://www.safety.queensu.ca/courses/](http://www.safety.queensu.ca/courses/). This training module is not intended as a stand-alone course. **You must complete the Queen’s TDG on-line course before doing the biohazard module. Then write both sections of the TDG quiz.**
6.0 Shipping and Receiving

Dangerous goods must be shipped and/or received only by TDG trained employees, or an employee working in the presence and under the direct supervision of an individual who holds a training certificate.

6.1 Damaged Packages

Damaged packages should be accepted by University receivers. Under the Packaging and Transport of Nuclear Substances Regulation, a consignee cannot refuse a shipment that is damaged, or allow it to be shipped from their possession if the shipment is knowingly not in compliance. This will apply to all shipments of dangerous goods. If you receive a damaged package note that it has been damaged on the accompanying shipping documentation and notify the shipper for reimbursements.

If you receive a damaged Class 7 Radioactive shipment, immediately notify the Radiation and Laser Safety officer at EH&S.

In case of an emergency such as a large spill contact EH&S.

Damaged goods shall be disposed through the Queen’s University hazardous waste disposal system.

6.2 Classification

The shipper is responsible for the proper classification of dangerous goods. Consult Appendix 1 for a list of TDG shipping classes. See appendix 1, 4, 5 for classification of biological and infectious substances. A Safety Data Sheet (SDS) may also provide the necessary information to properly classify your dangerous goods into one of the classes. If after consulting the regulations
you are still unsure of the class or the type of package required, contact the manufacturer, consult the original shipping documentation, or contact EH&S.

EH&S must be contacted when sending packages containing class 7 radioactive substances. The staff at EH&S have received additional training under TDG and the CNSC Transport Packaging of Radioactive Materials Regulation.

Shippers of dangerous goods must keep on file a “proof of classification” for all dangerous goods offered for transport or imported into Canada for a 5 year period from the date on the shipping document.

Proof of classification can include a:

- test report
- lab report or,
- document that explains how dangerous goods were classified. This includes:
  - an SDS specific to the chemical with matching CAS numbers and valid within 3 years, or a
  - Queen’s University: Transportation of Dangerous Goods Chemical Classification Profile. See appendix 6 for instructions and form. This form must also be used for all custom made solutions and new compounds.

Further information the proof of classification must have:

- Date of when the dangerous goods were classified,
- Technical name of dangerous goods,
- The classification of dangerous goods.

6.3 Packaging

According to the TDG Clear Language Regulation, some dangerous goods cannot be shipped above certain specified quantities unless an Emergency Response Assistance Plan (ERAP) has been developed. Consult the TDG handbook to see if your shipment falls under the amount specified in column 7 of schedule 1. ERAP quantities below 75 (L or Kg) are summarised in Appendix 3 of this document. If an ERAP is required for your shipment consult EH&S.

The means of transport determines the type of packaging that is required. Packages shipped only by ground must meet the packaging instructions as stated in the TDG Clear Language Regulation

Packages transported by air must meet the packaging requirements set out in the IATA Regulations. These must be purchased from IATA directly, or alternatively, EH&S can be contacted to obtain the required information.

The shipper is responsible for ensuring the outer package contains the following:

- The Shipping Name listed in upper case letters
- Hazard class label(s)
- Identification number (UN number)
- Packing group
- Orientation label (for liquids only)
- Standardized UN certification mark (Automatically appears on UN certified packaging)

Example of Dangerous Goods Safety Marks: Small Means of Containment
6.4 Documentation

The shipper is responsible for filling out the proper shipping documentation which can only be signed by a trained employee, or an untrained employee working in the presence and under the direct supervision of an individual who holds a training certificate. Three documents apply to the shipment of dangerous goods depending on the mode of transport and the type of goods being shipped:

- Straight Bill of Lading Form- for shipments by ground under TDG
- Shippers Declaration of Dangerous Goods Form- for shipments by air under IATA
- Waste Manifest- for shipments of hazardous waste Under TDG & Reg. 347/558

See Appendix 2 for sample shipping documentation.

Forms and labels can be obtained from couriers, online or from EH&S. Departments are responsible for maintaining shipping documentation on record for two years following the date of shipment. This is in addition to the requirement to retain the Proof of Classification for 5 years.

7.0 International Shipments

For international Shipments, Queen’s University contracts a customs broker to avoid delays at the border. Dangerous goods documentation must accompany the shipment. Additional information can be found on the Strategic Procurement Services website at: http://queensu.ca/procurement/home

8.0 Laboratory Relocation, Chemical Move

If your laboratory is moving and chemicals need to be transported to your new location please contact EH&S for assistance. For smaller amounts of chemicals transported within university owned buildings, EH&S may be able to provide free transport provided the chemicals are properly packaged.

For large amounts of chemicals or distances greater than 3 km, an independent contractor must be hired to properly package and transport the chemicals.
Further, researchers are required to provide an SDS for every chemical. These must be supplied to EH&S prior to the move. SDS should preferably be in electronic format, paper copies are also acceptable.

9.0 Shipments of Hazardous Waste by Queen's University Employees

For hazardous waste disposal refer to the “Hazardous Waste Disposal Procedures SOP-CHEM-01” document available at [http://www.safety.queensu.ca/hazwaste/wastedisposal.pdf](http://www.safety.queensu.ca/hazwaste/wastedisposal.pdf). EH&S must be contacted if the disposal of hazardous waste requires a third party contractor and is outside the University’s waste management system. Refer to section 10.0 for a list of documentation required prior to shipment authorization.

No one is authorized to sign a Waste Manifest unless they have received additional training by EH&S.

Waste Manifest documents must be forwarded to EH&S immediately as copy 1 (white) must be mailed to the Ministry of the Environment within three days of shipment.

10.0 Shipments of Hazardous Waste by Independent Contractors & PPS

If contractors are generating hazardous or non-hazardous waste, they are responsible for the disposal and shipment of the waste from Queen’s University, and must comply with all relevant legislative requirements. The contractors are to provide their own Ontario Waste Generator Number.

The Queen’s University Ontario Waste Generator Number CAN NOT be used unless approved by EH&S. This is absolutely necessary to avoid future liability for the University, and to comply with the current legislative requirements.

To obtain approval, EH&S must be provided with the following:

1. Analytical results identifying the type of waste and its shipping class.
2. Certificate of Approval (COA) of the CARRIER for the class being shipped.
3. “Schedule A” of the RECEIVER for the class being shipped.
4. A brief description of how and where the waste will be treated/disposed.

Note: EH&S may have the “COA” and “Schedule A” information on file, contact EH&S prior to sending any documentation.
A TDG trained representative from EH&S or other authorized individual will sign the waste manifest upon presentation of the above shipping documentation.

11.0 Exemptions under TDG

11.1 Dry Ice or Carbon Dioxide, Solid Used as Refrigerant

TDG Regulations do not apply to dry ice, UN 1845, used as a refrigerant provided the package is designed and constructed to permit the release of carbon dioxide (i.e. not air tight). The shipper must also include on the document that accompanies the shipment the words “Dry ice as refrigerant”.

11.2 Limited Quantities

Certain dangerous goods, except explosives, radioactives and infectious substances, are partially exempt from the TDG regulations. To be exempted, the overall package of goods must have a gross mass less than or equal to 30 kg and the package must be designed, constructed, filled, closed, secured and maintained to avoid any accidental release. Individually, a solid must have a mass expressed in kilograms, a gas or a liquid a volume expressed in litres that is less than or equal to the number shown for them in column 6 of Schedule 1 of the TDG regulations, or must meet the requirements as stated in section 2.8 of the IATA Regulation.

When using this exemption, each means of containment (i.e. box, etc.) must have a gross mass of 30 kg or less and display one of the following international marks:

Image A

Image B (in compliance with International Civil Aviation Organization (ICAO) Technical Instructions by Air)
Until December 31, 2020, instead of the international mark shown above, the means of containment may display:

- the words "Limited Quantity" or "quantité limitée";
- the abbreviation "Ltd. Qty." or "quant. ltée";
- the words "Consumer Commodity" or "bien de consommation";
- the UN number of each limited quantity of dangerous goods, preceded by the letters "UN", on a square on point (see example below).

11.3 Test Samples (TDG Ground Only)

TDG Regulations do not apply to samples of goods (except explosives, infectious substances or radioactive materials) if the gross mass is less than or equal to 10 kg and they are dangerous goods in transport for the purposes of classifying, analysing, testing or demonstrating. The samples must be accompanied by a shipping document that includes the name and address of the consignor and the words "test samples". The package must be designed, constructed, filled, closed, secured and maintained to prevent any accidental release. The package must have marked on it the words "test samples". Consult the regulations to determine if your goods fall under this exemption.

11.4 Dangerous Goods in an Instrument or in Equipment (TDG Ground Only)

TDG Regulations do not apply to goods that are contained in, and are not intended to be discharged from instruments or equipment that is designed to perform a function other than to solely contain dangerous goods. The instrument must not be listed as a dangerous good in schedule 1. A solid must have a mass expressed in kilograms, a gas or a liquid, a volume expressed in litres that is less than or equal to the number shown for them in column 6 of Schedule 1 of the TDG regulations.
11.5 Dangerous Goods in Excepted Quantities (IATA by Air)

Excepted Quantities Exemption under IATA (section 1.17.1) apply to goods below certain quantities as listed in the regulations. Packages that qualify for the exemption must be marked with an Excepted Quantities Label (see below). A Shipper’s Declaration of Dangerous Goods form is not required. Consult the regulations to ensure your goods fall under this exemption. [http://www.tc.gc.ca/eng/tdg/clear-part1-475.htm#sec1.17.1](http://www.tc.gc.ca/eng/tdg/clear-part1-475.htm#sec1.17.1)

**EXCEPTED QUANTITIES MARK**

Replace * with the primary class

Replace ** with the name of the consignor or the consignee

**12.0 Auditing**

EH&S reserves the right to select a department at random to audit their compliance with the TDG requirements under this procedure.
14.0 Contact Information

Department of Environmental Health & Safety
96 Albert St.
Main Office: ext. 32999
Fax: 33078

Dangerous Goods Shipments: ext. 74976
Radioactive Shipments: ext. 32951 or 74976
Biohazard Shipments ext. 77077
Appendix 1. Classification of Dangerous Goods

NINE CLASSES OF DANGEROUS GOODs (Summary)

**Class 1  Explosives**

- Class 1.1 Mass explosion hazard
- Class 1.2 Projection hazard but not a mass explosion hazard
- Class 1.3 Fire hazard and either a minor blast hazard or a minor projection hazard or both but not a mass explosion hazard
- Class 1.4 No significant hazard beyond the package in the event of ignition or initiation during transport
- Class 1.5 Very insensitive substances with a mass explosion hazard; and
- Class 1.6 Extremely insensitive articles with no mass explosion hazard

**Class 2  Gases**

- Class 2.1 Flammable gases
- Class 2.2 Non-flammable and non-toxic gases
- Class 2.3 Toxic gases

**Class 3  Flammable Liquids**

**Class 4  Flammable Solids; Substances Liable to Spontaneous Combustion; Substances That on Contact with Water Emit Flammable Gases (Water-reactive: Substances)**

- Class 4.1 Flammable Solids
- Class 4.2 Substances liable to spontaneous combustion
- Class 4.3 Water-reactive substances

**Class 5  Oxidizing Substances and Organic Peroxides**

- Class 5.1 Oxidizing substances
- Class 5.2 Organic peroxides

**Class 6  Toxic and Infectious Substances**
Transportation of Dangerous Goods

Class 6.1 Toxic substances
Class 6.2 Infectious substances

Class 7 Radioactive Materials

Class 8 Corrosives

Class 9 Miscellaneous Products, Substances or Organisms

CLASS 1 - Explosives

Explosives may be capable, by chemical reaction, of producing gas at a temperature, pressure and speed that would damage the surroundings. Alternatively, they may produce an explosive or pyrotechnic effect by heat, light, sound, gas or smoke, or a combination of those means as a result of non-detonative, self-sustaining exothermic chemical reactions.

Class 1 has six divisions:

Class 1.1 mass explosion hazard
TNT; TETRYL

Class 1.2 projection hazard but not a mass explosion hazard
GRENADES; BOMBS
Class 1.3 fire hazard and either a minor blast hazard or a minor projection hazard or both but not a mass explosion hazard
FIREWORKS

Class 1.4 no significant hazard beyond the package in the event of ignition or initiation during transport
FLARES, AERIAL

Class 1.5 very insensitive substances with a mass explosion hazard
EXPLOSIVE, BLASTING, TYPE B
Class 1.6  extremely insensitive articles with no mass explosion hazard
ARTICLES, EXPLOSIVE, EXTREMELY INSENSITIVE

Explosives are divided into 13 compatibility groups as described in Appendix 2 of the TDG Regulations. Compatibility groups are used to determine which explosives may be transported together. See table on page 57.

Class 1.1, 1.2, 1.3

Label and Placard

** place for division – to be left blank if explosive is a subsidiary class

* place for the Compatibility Group Letter – to be left blank if explosive is a subsidiary class

Class 2, Gases has three divisions:

Class 2.1  flammable gases
Propylene; Acetylene, Dissolved

Class 2.2  non-flammable and non-toxic gases
NITROGEN, REFRIGERATED LIQUID;
AIR, COMPRESSED

Class 2.3  toxic gases
CHLORINE; CYANOGEN

Oxidizing Gases
THERE ARE NO PACKING GROUPS FOR GASES.

CLASS 3 - Flammable Liquids

Flammable Liquids have a flash point less than or equal to 60.50°C, or are intended to be transported at a temperature not less than their flashpoint.

**Class 3**

flammable liquids

ACETONE; PAINT; ADHESIVES

---

**DETERMINATION OF THE PACKING GROUP**

<table>
<thead>
<tr>
<th>Packing Group</th>
<th>Flash Point</th>

<tr>
<td>PG II</td>
<td>Less than 23 C</td>
<td>Greater than 35 C</td>
</tr>
<tr>
<td>PG III</td>
<td>23 C or more</td>
<td>Greater than 35 C</td>
</tr>
</tbody>
</table>
CLASS 4 - Flammable Solids; Substances Liable to Spontaneous Combustion; Substances That on Contact with Water Emit Flammable Gases (Water-reactive Substances)

Class 4 has three divisions:

**Class 4.1** flammable solids (substances which are readily combustible, liable to cause fire through friction, desensitised explosives or self-reactive substances) SAFETY MATCHES; NITROCELLULOSE WITH ALCOHOL

![Flammable Solids Symbol]

**Class 4.2** substances liable to spontaneous combustion (substances which are pyrophoric or self-heating) PHOSPHORUS, WHITE, MOLTEN; SODIUM SULFIDE

![Spontaneous Combustion Symbol]

**Class 4.3** water-reactive substances (substances which emit a flammable gas or spontaneously ignite in contact with water) SODIUM; LITHIUM

![Water-Reactive Substances Symbol]
CLASSES 4.1, 4.2 AND 4.3 PRODUCTS ARE ASSIGNED PACKING GROUPS.

CLASS 5 - Oxidizing Substances and Organic Peroxides

Class 5 has two divisions:

Class 5.1 oxidizing substances (substance which yield oxygen. Thereby causing or contributing to the combustion of other material)
CALCIUM HYPOCHLORITE; ZINC PEROXIDE
OXIDIZING SUBSTANCES ARE ASSIGNED PACKING GROUPS

Class 5.2 organic peroxides (substances which contain the "-0-02" chemical structure and may be unstable)
ORGANIC PEROXIDE TYPE D, SOLID
(type B to F)

ORGANIC PEROXIDES (TYPE B TO F) ARE INCLUDED IN PACKING GROUP H.
CLASS 6 - Toxic and Infectious Substances

Class 6 has two divisions:

**Class 6.1** Toxic Substances (substances which pose a serious threat to human health or life if absorbed through the skin, swallowed, or inhaled) PHENOL; CARBON TETRACHLORIDE, STRYCHNINE, ARSENIC) Toxins from plant, animal or bacterial sources which do not contain any infectious substances, or toxins that are not contained in substances which are infectious substances should be considered for classification in Class 6.1 and assigned to UN 3172.

![Toxic Substances]

**TOXIC SUBSTANCES ARE ASSIGNED PACKING GROUPS.**

**Class 6.2** Infectious Substances - organisms (e.g. bacteria, viruses, fungi) or substances that contain organisms that are infectious or that are reasonably believed to be infectious to humans or to animals.

![Infectious Substances]

Those who work with infectious materials will be familiar with the Risk Group classification used by the Public Health Agency of Canada and the Canadian Food Inspection Agency (as defined in Queen’s University Biohazard Risk Group Definitions, SOP-Biosafety-05). However, TDG regulations do not use Risk Group classifications. **Infectious substances must be classified in Division 6.2 and assigned to UN 2814, UN 2900, UN3291 or UN 3373 as described below and in the classification flow chart in Appendix 5.** The regulations contain the definitions noted below and a table that lists examples of agents which fall into Category A.
However the table is not an exhaustive list. A good rule of thumb is that if the material has to be cultured using containment level 3 operational practices, or with higher physical or operational containment then it must be shipped as Category A. Some organisms if present in any form, even in diagnostic samples, must be shipped as Category A (e.g. Ebola virus), whereas many other organisms are Category A only if shipped as cultures (e.g. Hepatitis B virus). If you are in doubt contact the University Biological Safety Officer. The regulations state that if there is doubt as to whether or not a substance meets the criteria it must be included in Category A.

**Infectious Substance, Category A** - An infectious substance that is transported in a form such that, when it is released outside of its means of containment and there is physical contact with humans or animals, it is capable of causing permanent disability or life-threatening disease in otherwise healthy humans or animals. Many examples are given in the list in Appendix 6. Other infectious material that causes similar health risk to humans or animals to those agents on the list must also be classified as Category A.

UN 2814, Infectious substance, affecting humans (this is the proper shipping name) – a Category A substance which causes disease in humans or both in humans and animals, e.g. HEPATITIS B (cultures only), HUMAN IMMUNODEFICIENCY VIRUS (cultures only), EBOLA VIRUS. Packaging must be UN certified, drop and crush tested. For air transportation follow IATA packaging instruction 602 and see IATA regulations for other details. For ground transportation only, follow TDG regulations, packaging group Category A.

UN 2900, Infectious substance, affecting animals (this is the proper shipping name) – a Category A substance which causes disease only in animals, not humans, e.g. FOOT AND MOUTH DISIEASE VIRUS (cultures only), VESICULAR STOMATITIS VIRUS (cultures only). Packaging must be UN certified, drop and crush tested. For air transportation follow IATA packaging instruction 602 and see IATA regulations for other details. For ground transportation only, follow TDG regulations, packaging group Category A.

*Note: assignment to UN 2814 or UN 2900 must be based on the known medical history and symptoms of the source human or animal, endemic local conditions, or professional judgement concerning individual circumstances of the source human or animal.*

**Infectious Substance, Category B** - An infectious substance which does not meet the criteria for inclusion in Category A.

- Infectious substances in Category B must be assigned to UN 3373.
• Specimens containing Category B microorganisms that are transported for the purposes of diagnosis, investigational purposes, research, disease treatment or prevention are assigned to UN3373.
• The proper shipping name of UN 3373 is Biological substance category B. Previously acceptable shipping names for UN 3373 also included “Clinical specimens” or “Diagnostic Specimens” however from 1 January 2007 it was anticipated that the use of those shipping names would no longer be permitted –
• Transport marking must be displayed on the external surface of the outer packaging.
• For air transportation follow IATA packaging instruction 650 and see IATA regulations for other details. For ground transportation only, follow TDG regulations, packaging group Category B. Packaging and documentation requirements are lower than for Category A. Packaging does not need to be UN certified, and testing of the packaging is not as rigorous as for Category A, but there are requirements so special UN3373 shipping boxes should be purchased.

Exemptions:
The following are exempt from TDG regulations unless they meet the criteria for inclusion in another class:

• Substances which do not contain infectious substances or that contain micro-organisms which are non-pathogenic to humans or animals i.e. risk group 1 micro-organisms would not be subject to TDG regulations
• Pathogens that have been neutralized or inactivated
• Environmental samples (including food and water samples), which are not considered to pose a significant risk of infection
• Dried blood spots, collected by applying a drop of blood onto absorbent material, or fecal occult blood screening tests and blood or blood components which have been collected for the purposes of transfusion or for the preparation of blood products to be used for transfusion or transplantation and any tissues or organs intended for use in transplantation

Patient specimens:
• Must be assigned to UN 2814, UN 2900, or UN 3373 as appropriate except if they meet one of the above criteria or if there is a minimal likelihood that pathogens are present and if the specimen is packed in a packaging which will prevent any leakage and which is marked with the words “Exempt human specimen” or “Exempt animal specimen” as appropriate.

Note: in determining whether a patient specimen has a minimal likelihood that pathogens are present, an element of professional judgment is required to determine if a substance
is exempt under this paragraph. That judgment should be based on the known medical history, symptoms, and individual circumstances of the source human or animal, and endemic local conditions. Examples of specimens which may be transported under this paragraph include the blood or urine tests to monitor cholesterol levels, blood glucose levels, hormone levels, prostate specific antigens (PSA); test required to monitor organ function for humans or animals with non-infectious diseases; biopsies to detect cancer, etc.

- Packaging for “Exempt human/animal specimens” must meet the following conditions:
- Packaging must consist of three components:
  - leak-proof primary receptacle(s)
  - leak-proof secondary packaging
  - an outer packaging of adequate strength for the capacity, mass and intended use, and with at least one surface having minimum dimensions of 100 mm x 100 mm
- for liquids, absorbent material in sufficient quantity to absorb the entire contents must be placed between the primary receptacle(s) and the secondary packaging so that, during transport, any release or leak of a liquid substance will not reach the outer packaging and will not compromise the integrity of the cushioning material
- when multiple fragile primary receptacles are placed in a single secondary packaging, they must be either individually wrapped or separated to prevent contact between them.

Medical or Clinical Wastes
Medical or clinical wastes containing Category A infectious substances must be assigned to UN 2814 or UN 2900, as appropriate. Medical or clinical wastes containing infectious substances in Category B, must be assigned to UN 3291.

- Proper shipping name for UN3291 is Clinical waste, unspecified, n.o.s. or (Bio) Medical waste, n.o.s. or Regulated medical waste, n.o.s.
- At Queen’s all waste requiring this label would be packaged and documented by the Department of Environmental Health and Safety
- Decontaminated medical or clinical wastes are not subject to these regulations unless they meet the criteria for inclusion in another class

Genetically Modified Micro-organisms
Genetically modified micro-organisms not meeting the definition of an infectious substance must be classified according to Subsection 3.9 of the IATA regulations regarding Class 9 – Miscellaneous Dangerous Goods (see below and contact Biosafety Officer).
Prohibitions
A live animal that has been intentionally infected and is known or suspected to contain an infectious substance must not be transported by air unless the infectious substance contained cannot be consigned by any other means. Infected animals may only be transported under terms and conditions approved by the appropriate national authority.

Passenger Provisions
Category A or B Infectious Substances are not permitted for transport in carry-on or checked baggage and must not be carried on a person. Packages containing Exempt human or animal specimens may be carried in checked or carry-on baggage provided that they meet the applicable packaging requirements.

CLASS 7 - Radioactive Materials

Substances with a specific activity greater than 70 kBq/kg are included in Class 7, Radioactive Materials. Radioactive materials are represented by categories (activity groups) from I to III, category III being the most dangerous one. The transport index must be calculated and identified on the package using the proper label. Radioactives are also regulated according to the 'Packaging and Transport of Nuclear Substances Regulations.'

Class 7 includes:

Category I - White
the contents and activity must be displayed

Category II - Yellow
the contents, activity and transport index must be displayed
Category III – Yellow

the contents, activity and transport index must be displayed

Category I – White

Label and Optional Placard

Class 7, Radioactive Materials

Category II – Yellow
Label and Optional Placard

Class 7, Radioactive Materials

Category III – Yellow

Placard
The word “RADIOACTIVE” is optional.

Class 7, Radioactive Materials

CLASS 8 - Corrosives

Corrosives are known to cause permanent damage of human skin and/or cause corrosion of other substances. They can violently react with other substances to create an explosion, toxic vapours, etc. It is important to separate acids and bases (caustics, alkaline products) that are generally incompatible.

Class 8  corrosives
SODIUM HYDROXIDE,
SOLUTION; SULFURIC ACID

CORROSIVES ARE ASSIGNED PACKING GROUPS.

CLASS 9 - Miscellaneous Products, Substances or Organisms
A substance is included in Class 9, Miscellaneous Products, Substances or Organisms, if it does not meet the criteria for inclusion in any of Classes 1 to 8 and:

- is included in Class 9 in Schedule 1 of the TDG Regulations;

- contains a genetically modified micro-organism or organism that does not meet the definition if infectious substances but which are capable of altering animals, plants or microbiological substances in a way which is not normally the result of natural reproduction. They must be assigned to UN 3245, unless authorised for use by the appropriate national authorities of the states of origin, transit and destination.

- is listed in Appendix 1, Marine Pollutants, of the TDG Regulations, and is intended for marine transport;

- is offered for transport or transported at a temperature greater than or equal to 100°C (liquid) or 240°C (solid) - except for asphalt or tar
  - UN3257, elevated temperature liquid, n.o.s.
  - UN3258, elevated temperature solid n.o.s

- Is intended for disposal and
  - Is a leachate toxic according to the leachate concentrations listed in appendix 4, Part 2; or
  - contains a chemical at or above the concentration listed in Appendix 5, Part 2.
    - UN3082, ENVIRONMENTALLY HAZARDOUS SUBSTANCES, LIQUID, N.O.S.
    - UN3077, ENVIRONMENTALLY HAZARDOUS SUBSTANCES, SOLID, N.O.S.

Appendix 4: Classification of Infectious Substances

Substance for classification

— Have any pathogens been neutralised/inactivated?
— Is it known not to contain infectious substances?
— Are all micro-organisms present non-pathogenic for humans/animals?
— Is it a dried blood spot/feecal occult blood?
— Is it an environmental sample, e.g. food and water that is not considered to pose a significant health risk?
— Is it for transplant/ transfusion?

Yes to any

Does it meet the definition of a category A substance?

No to all

Yes

Is it a patient specimen for which there is only a minimal likelihood that pathogens are present?

No

## Appendix 5: Indicative Examples of Infectious Substances Included in Category A in Any Form Unless Otherwise Indicated

Appendix 6. Queen’s University: Transportation of Dangerous Goods Chemical Classification Profile

Please fill out the following form as accurately as possible then forward the completed and signed copy to the Department of Environmental Health and Safety, safety@queensu.ca, attention Tom Martinek. We will assign the proper TDG shipping categorization and will return the form back to you. You as the shipper, must keep this form on file for five years from the date of shipment.

Special Instructions:

The above classification was assigned based on information provided by Queen’s researchers and technicians in this chemical classification profile. The TDG classification and packing group has been assigned based on the classification and packing group of the pure constituents as listed in the Composition of Waste Table, taking into account the concentration of the constituents in the solution /mixture. Further, taken into account were the physical properties and reactivity and hazard characteristics as listed in this profile.

REACTIVITY / HAZARDOUS CHARACTERISTICS

Is this waste any of the following? (Please ensure that at least one box is checked)

- Explosive
- Pyrophoric
- Ignitable Solid
- Shock Sensitive
- Oxidizer
- Air Reactive
- Water Reactive
- Polymerizable
- Radioactive
- Biological
- Asbestos
- Activated Carbon
- Reactive Cyanide
- Reactive Sulfide
- Nitro Cellulose / Lacquer Dust
- None of the Above
- Other (Please Describe)

ATTACHMENTS

Please check documentation included as attachments for this waste stream:

- Profile Only
- Sample
- Material Safety Data Sheet (MSDS)
- Analysis (if yes, please specify)
- TCLP (Reg. 558)
- LEP (Reg. 347)
- Other (please specify): Elements by Atomic Spectroscopy (Water), PCB Analysts

GENERATOR CERTIFICATION

As an employee and authorized representative of the Generator, I hereby certify that information contained in this profile is a complete and accurate representation of all known and/or suspected hazards of the material(s) described.
